

Spring Peepers

(Pseudacris crucifer)

Spring peepers are a kind of small tree frog, which is spread all over the Eastern United states. These frogs don't grow over 2 inches and have a very distinctive call, because it's very loud. That's how they got the name peepers.

The spring peeper eats small insects such as small spiders, ants, and water bugs. Peepers breed from March to June when it starts to rain for a long time. One frog can lay up to 1000 eggs at a time.

They hibernate in the winter under logs, loose bark and leaf litter. You can find peepers because of their distinct X marking on there back. They came in lots of colors like, tan, brown, olive green, or gray.

You can find spring peepers in all types of water and on trees.
